1950 Inherits Renewed Vigor of '49 Economy

B ANKERS, businessmen, and other observers of the economic scene are more optimistic at the beginning of 1950 concerning the near-term business trend than they were in the early months of 1949.

Whereas a year ago businessmen were preparing for a decline in the demand for their products and services—which did not materialize in most areas—today they are acting on the assumption that consumer income and expenditures will hold at high levels for at least a few months.

This feeling of cautious optimism is attributable to the recuperative power shown by the economy in 1949. By reason of the downward movement in business in the first half followed by recovery later in the year, the business world has been given grounds for thinking that a severe depression is not imminent.

Probably the best single source of information concerning national economic developments in 1949 is "The Annual Economic Review," January 1950, a report to the President by the Council of Economic Advisers. This review, excluding policy recommendations, is followed closely in succeeding paragraphs.

A review of 1949 on the national plane reveals that:

- Gross national product declined from \$262.4 billion in 1948 to \$258.7 billion in 1949, or 1.5%.
- Average civilian employment fell from 59.4 million in 1948 to 58.7 million in 1949, a drop of 700,000.
- Wholesale prices declined 6.9% from the end of 1948 to the end of 1949, attributable largely to sharp drops in farm food prices. Consumer prices, however, did not follow wholesale prices all the way on the downward course.
- Consumer income and expenditures were about equal to the levels of 1948.

During the Cutback in Production in Early 1949, Consumer Buying Stayed High, Thereby Fostering the Recovery Which Has Carried Over Into 1950

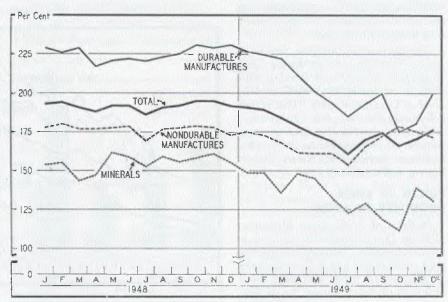

By J. MARVIN PETERSON

- Net personal saving fell steadily in 1949, yet was greater for the year than in 1948.
- Gross private domestic investment declined \$8.2 billion, or about 18%, attributable largely to a shift from inventory accumulation to inventory liquidation.
- Total U. S. export surplus rose in the first half of 1949 over 1948, then fell drastically in last half.
- The net cash position of federal, state, and local governments shifted from a surplus of over \$7 billion in 1948 to a deficit of \$3 billion in 1949.

Persons who thought that total production of goods and services should increase 3 or 4% in 1949,

INDUSTRIAL PRODUCTION IN THE UNITED STATES

1935-39 = 100

INDUSTRIAL production by December 1949 had recovered nearly half the drop from its November 1948 low to its July 1949 low.

Source: Department of Labor.

were mildly disappointed. Instead of an increase of \$8 to \$10 billion (3 or 4%), a drop in the dollar value of all goods and services produced (gross national product) of about 1.5% occurred. Both lower prices and a drop in real output contributed to a decline in gross national product from \$262.4 billion in 1948 to \$258.7 billion in 1949.

Industrial production reached a peak of 195 (1935-39 average equals 100) in October 1948, fell to 161 in July 1949, and recovered to 175 in December. The greatest decline, as the accompanying chart indicates, occurred in durable manufactures and minerals, while nondurable manufactures held up quite well. The influence of work stoppages in coal and steel, which interrupted the recovery in industrial production which began in July, is also apparent on the chart.

The year-end recovery was led by nondurable manufactures, the output of which increased 12% from the low point compared with an 8% increase in durables. In some industries, notably construction, gas and electricity production for the year as a whole exceeded that of 1948.

EMPLOYMENT SUFFERED SLIGHT SLUMP

The decline in civilian employment which began late in 1948 and continued in the early months of 1949 was checked first in agriculture and thereafter in industry during the second quarter of the year.

By the end of the year, despite a steady recovery, except during work stoppages, employment stood at 58.6 million, or about 850,000 below the level of December 1948. This record fell short of the increase of about one million needed to absorb a growing number of employable workers. (See business section for Ninth district figures and analysis.)

PRICES OF FARM PRODUCTS DECLINED

A drop of 6.9% from December 1948 to December 1949 occurred in wholesale prices. Most of this decline took place in the first half of the year. In the second half, wholesale farm and food prices continued the decline, while industrial prices were held on a level plane.

Wholesale farm product prices and prices received by farmers fell 12% in 1949, which was 20% below the

high point of January 1948. Farmers: thereupon received less than parity prices for their products as a group for the first time since 1941. (See agriculture section for Ninth district figures and analysis.)

While prices received by farmers were declining 20% from peak 1948 levels, industrial prices were falling only 5.3%. At the same time, prices paid by consumers at the retail level did not follow wholesale prices very far on the downward path. From the postwar peak to the 1949 low point, such prices receded only 3%. Wholesale food items fell in price 12.5% from December 1948 to December 1949, while consumers' prices for those items in the same period fell 2%.

The accompanying tables show changes in wholesale prices and consumers' prices in selected commodity groups from December 1948 to December 1949.

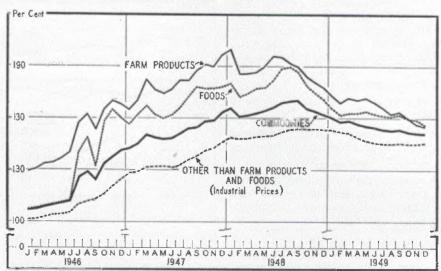

CONSUMER EXPENDITURES HELD TO '48 LEVELS

Retailers and manufacturers who at the beginning of 1949 had expected a rather sharp drop in consumer expenditures received a pleasant sur-

AGRICULTURE

Farmers' Purchasing Power Pared During '49

NINTH district farmers took an economic "rap" during 1949. Farm product prices declined, Ninth district crop production was down sharply as a result of both early and late season drouths, and farm costs stayed relatively high.

The reduction in farm prices and crop production during 1949 is in sharp contrast to the trend in prices and production since 1940. During much of the period between 1940 and 1949, farm production attained record proportions, farm prices reached new highs, and farm production costs were relatively low.

Unprecedented demand for farm products occurred during this period as a result of expanded consumer incomes, huge farm exports, and government purchases of surplus products for price support purposes. Record crop production was encouraged by high prices, along with new techniques in production and favorable weather.

Economic changes during 1949 indicate, however, that the greatest and longest period of lush farm prosperity in history may be nearing an end. These adjustments on the farm economic front are likely to have a continuing major impact on the economy of the entire Ninth district.

SOME FARM PRODUCT PRICES DECLINE ONE-THIRD

Prices received by farmers during 1949 averaged almost 13% below 1948. However, quite a number of important farm products produced in the Ninth district declined substantially more than 13% in price during the year. Hog, poultry, and egg prices late in 1949 were down a full third from late 1948 levels.

Corn prices averaged \$1.76 a bushel to farmers in 1948. In 1949 the average price of corn was only \$1.05, a decline of 40%. Wheat prices in 1949 averaged 12% below those of the previous year. Oats prices were down 35%, barley 36%, and flaxseed 27%.

On the other hand, all grain prices would have been much lower in 1949 if the government had not been supporting them by loans and purchases.

Beef cattle, veal calves, and sheep prices held up well in 1949 without government subsidy. Prices of butterfat and milk, however, slipped almost one-fourth in spite of enormous purchases of butter and dried milk by government agencies.

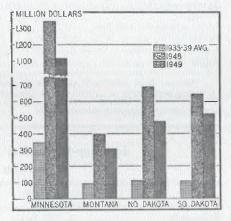

In spite of the sharp decline in prices of farm products during 1949, prices were still high in relation to pre-war. In fact, the general level of farm prices in late December 1949 was about 21/4 times the average of the 1935-39 period.

CROP PRODUCTION DOWN APPROXIMATELY 17%

Contrary to general opinion, 1949 was not a particularly good crop production year for the Ninth district as a whole. Both early and late season drouths took a heavy toll in much of the western area of the district.

As a result, wheat production in 1949 was the smallest since 1940. Corn, oats, flaxseed, and soybean production were down, ranging from 18% to 22% from the previous year.

CASH INCOME FROM FARM MARKETINGS IN NINTH DISTRICT STATES, 1935-39 Average, 1948 and 1949

CASH FARM INCOME during 1949 in Ninth District states was off about 20% from 1948 high levels. It is still three to four times pre-war figures.

Source: USDA Farm Income Situation.

- Declining farm prices and reduced crop production cut district cash farm income about 20%.
- Farmers' real purchasing power was down but still almost double pre-war.
- Short term farm loans continued their upward trend.
- Land values in the district took a downward turn.

Complete data are not yet available on 1949 production of livestock and livestock products in the Ninth district, but there is evidence that increases predominated. For one thing, generally favorable livestock-feeding relationships during the year encouraged livestock production. More pigs were raised; there was an increased interest in poultry and turkey production; and more cattle were put on grain-feed. Livestock numbers in general were on the increase.

FARM EXPENSES STAY HIGH

In contrast to sagging prices for farm products in 1949, farm expenses as a group declined only about 3%. Most of this slight cost decline was in food and feeds. Some farm equipment and machinery items were even higher in price, reflecting such factors as increased labor costs in their manufacture and sale.

Some of the costs of producing farm products—such as taxes, depreciation, and insurance—are relatively "fixed"; at least these costs tend to change very slowly over a period of years. Farm real estate taxes in 1949, however, showed considerable increase on most Ninth district farms.

Farm prosperity in recent years, accompanied by a phenomenal increase in rural electrification and farm mechanization, has greatly changed and enlarged farm family spending patterns.

Once farmers have adopted new equipment and gadgets of all sorts that increase the ease of farm operations and their standard of living, they try to maintain the new standard even though farm income falls. This is what happened during 1949.

CASH FARM INCOME OFF 20%

Compared with 1948, Ninth district farmers took a more serious economic beating in 1949 than did farmers for the U. S. as a whole. They also suffered more serious declines in purchasing power than other major economic groups.

Cash farm income in the district was estimated to be off 20% from 1948 high levels. For the U. S. as a whole, the decline was only about 11%.

District cash farm income in 1949 was the smallest since 1945. At that, farmers in 1949 had almost \$3.50 to ring up on the cash register for every one dollar they were able to accumulate in the 1935-39 period.

Cash farm income, however, is different from the income the farmer is able to put on deposit at his home bank or to use for any one of hundreds of wants and needs that all farmers share.

When production expenses are removed from 1949 cash income, the farmer's "take-home" pay looked much smaller.

One way to measure the farmer's real economic position in 1949 compared with pre-war is to deflate 1949 cash farm income in terms of 1935-39 dollars.

If this is done, Ninth district farmers actually had nearly twice the real purchasing power in 1949 compared with pre-war. This increase was due to increased marketings and to relatively high prices received by farmers.

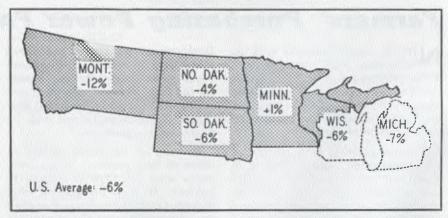

From the farmer's point of view, however, his 1949 income had to be spread thinner than in other recent years to meet changes in methods of farming and the new standard of farm living.

FARM CHATTEL LOANS UP SHARPLY IN 1949

A flood of new farm machinery, electrical appliances, and equipment of all kinds bid for the farmer's dollar in 1949. The average farmer wanted—and in many cases needed—to modernize and to further improve his working capital and his standard of living.

However, smaller crops and lower Continued on Page 11, Col. 1

PERCENTAGE CHANGE IN DOLLAR VALUE OF FARM LAND* November 1948 to November 1949

BUSINESS

Area Business Below '48 but Up at Year-end

A T THE END of 1949 the economy of the Ninth Federal Reserve district was still in a prosperous condition, although some contraction from the postwar peak occurred in business activity during the year.

Employment was still high, the population migration out of this district had ceased, the construction industry still had a substantial volume of projects on hand, and department store sales for the year were down only 5%.

Occupying a key position in any appraisal of business conditions is the level of employment. When nearly all individuals are employed—except those shifting from one job to another—consumer purchasing power is high and business concerns prosper as a result of a large volume of transactions.

On the other hand, consumer purchasing power falls off and the volume of business transacted slumps when employment is down.

DISTRICT EMPLOYMENT STILL CLOSE TO POSTWAR PEAK

Employment in all types of nonagricultural industries in Montana set a new postwar record early in 1949. Since September the usual seasonal contraction has taken place in employment there.

According to the recent report issued by the Unemployment Commission of Montana, December saw employment for the first time in 1949 slightly below the total for the corresponding month in 1948.

On the basis of the sketchy information available, employment in non-agricultural industries in North and South Dakota held up well in 1949 but did fall slightly below the level of employment in the former year.

In Minnesota such employment declined during the spring and early summer months due to the business recession in industrial areas. Even though employment again picked up during the latter half of the year, December employment was still down almost 4% as compared with the December 1948 figure, according to the

recent report issued by the Minnesota Division of Employment and Security.

In the Upper Peninsula of Michigan, employment recovered from the coal and steel strikes, but it was more than 6% under December 1948, according to the report issued by the Michigan Unemployment Compensation commission. The lumber and wood products industry was operating below normal, but prospects were for a considerable increase in activity during the next 90 days.

In the state of Wisconsin, employment in non-agricultural industries in November was down 6% from the level of employment in November 1948, according to the report issued by the Industrial commission. As in the Upper Peninsula of Michigan, the effect on employment of the coal and steel strikes had largely disappeared.

EMPLOYMENT IN MANUFACTURE OF DURABLE GOODS DROPPED

From this brief resume of employment in the various types of businesses (exclusive of farms) in this district, it is evident that employment at the end of 1949 was still at a relatively high level. During the past year, this district experienced no distressed unemployment as was the case in a few metropolitan centers in the nation.

The lower level of employment is traced, in a large measure, to manufacturing concerns and, more specifi-

- District employment was at a relatively high level at the end of the year, which saw durable goods fabricators operating with reduced labor forces. Montana non-agricultural industries set postwar record.
- District population reversed its trend, approximating or surpassing the estimated national average from July 1, 1948, to July 1, 1949. North and South Dakota increased 4.0% and 6.3% respectively.
- Valuation of building permits issued by representative cities in the district was up 21% in the last half of 1949. Residential contracts awarded were up 50% in October and November.
- The downward trend in department store sales continued in 1949. Rural sales reflected the contraction in farm income.

cally, to those concerns producing durable goods. The fabricators of metal products and the manufacturers of all types of machinery in particular, are operating with substantially smaller labor forces than in former postwar years.

During the past year, wage rates in most instances remained at the former level or were raised. Furthermore, labor in manufacturing con-

p-preliminary.

cerns toward the end of the year was still working slightly over 40 hours per week. Under these conditions, consumer purchasing power in urban centers remained high—as reflected in the large amount of sales in department stores.

DISTRICT POPULATION INCREASED SIGNIFICANTLY

The opportunities for employment in the Ninth district since the summer of 1948 appear to have been equal to those found in other regions of the nation. As a result, the migration of population out of this district, so prevalent during the war years, has ceased.*

During the war years, the Ninth district lost population through migration primarily into the states on the west coast and to the Chicago and Detroit industrial areas. From July 1, 1948, to July 1, 1949, the population in this district increased faster than in the nation as a whole—which leads to the conclusion that the emigration out of this district has ceased and there may have been some net immigration.

It is estimated that in the United States the civilian population increased by 1.7% from July 1, 1948 to July 1, 1949. Such was also the approximate increase in Minnesota and Montana. However, in North and South Dakota the estimated increase of 4.0% and 6.3%, respectively, greatly exceeded the national average.

Since the emigration of population out of this district has ceased, the population in Minnesota is now approximately 7% larger than it was at the time of the 1940 census. In South Dakota, where the population during the war years fell noticeably below the 1940 census figure due to emigration, the population has recently grown to a point where it has surpassed the former census figure. In Montana and in North Dakota the estimated population on July 1, 1949, was still 7.5% and 5.8%, respectively, below the 1940 census totals.

CONSTRUCTION ACTIVITY CONTINUES HIGH

Activity in the construction industry is an important factor in main-

its use of construction materials indirectly employs a large number of laborers.

Valuation of building permits issued by representative cities in the Ninth district has been high. During the last half of 1949, total valuation exceeded by 21% the corresponding figure for the last half of 1948. Such a large total valuation of building permits provides evidence that a large number of construction projects are in the blue print stage.

The amount of construction contracts awarded, as compiled by the F. W. Dodge Corporation, reflects a similar picture of high activity in the construction industry in this region. In residential building the amount of contracts awarded in recent months was over 50% larger than in the corresponding months of 1948. The awards made for public building also have been high.

To secure more information on the type of construction in the blueprint stage, a tabulation was made of the contracts let in the past few weeks for various kinds of projects as

BANKING

Banks Took Adjustments of 1949 in Stride

B USINESS, agriculture, and banking in 1949 came face-to-face with a hard-boiled test: could the economy settle down from the booming postwar inflation without suffering a devastating collapse?

The other sections of this Review describe the course of business and agriculture. On these fronts, for 1949 at least, the answer was favorable—although farmers, who generally enjoyed the favored spot in the sun during the boom, found the going somewhat rougher in 1949 than did industry and trade.

This year's record for banking in the Ninth district—and in the United States as well—showed that banks, too, took the adjustments of 1949 in stride. Moreover, the underlying soundness of the banking system contributed an important element of strength to economic stability.

TOTAL LOANS ROSE, BUSINESS LOANS DECLINED

Total loans in Ninth district member banks edged up 1% during 1949. Standing at \$895 million at the close of the year—a new all-time high—total loans had increased \$11 million over a year ago.

The relative stability in total bank loans in 1949 contrasted sharply with the galloping expansion of the earlier postwar years. From December 1945 to December 1948, total loans in Ninth district member banks increased at an annual average rate of roughly 25%.

A look at the trend of loans in country and city banks in 1949 shows:

• Total loans in Ninth district country member banks increased \$16 million—up 3½% during 1949. The

Total loans in Ninth district member banks at year-end 1949 topped a year ago by 1%; business loans in city banks, however, declined sharply.

U. S. government security portfolios rose 5% in 1949, as banks invested funds released by reduced reserve requirements.

 Modified Federal Reserve open market policy signaled a shift to greater flexibility in monetary management.

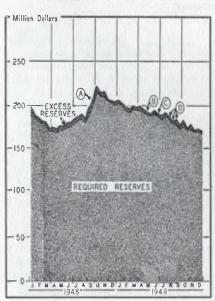

Demand deposits, other than interbank, in Ninth district member banks shrank 1%.

main bulge in lending came in the late winter and early spring when preparations for the new crop year—purchases of seed, fertilizer, and machinery—sent farmers to banks seeking short-term loans. Demand for Commodity Credit Corporation loans buoyed up loan totals during the rest of the year.

In addition, after a lull in the early months of 1949, country banks expanded real estate and consumer loans.

- Total loans in Ninth district city banks (20 weekly reporting banks located in the district's larger cities) declined from \$439 million on December 31, 1948, to \$434 million on December 28, 1949—down 1%. Commercial, industrial, and agricultural loans took a nose dive of 14% in 1949—mainly in the first half of the year. This drop was partly offset, however, by the almost steady rise in real estate and consumer loans which got underway in the spring and persisted through the end of the year.
- The decline in business loans in the first half of 1949, which occurred to an even more marked degree nationally than in the Ninth district, reflected several factors.

Most important were: that businesses were cutting expenditures, inventories were reduced, expansion

plans were curtailed, and falling prices resulted in lower working capital requirements. In some instances bank loans were repaid with funds acquired through security issues.

• The low point in business loans in Ninth district city banks was touched in May-two months before the turning point in the nation as a whole. Ninth district city bankers then saw their business loan totals spurt upward for three months, erasing roughly half of the previous month's decline.

Businessmen, in many instances, had let inventories fall too low. Purchases for restocking, added to the usual summer and early fall inventory accumulation, revitalized demand for business loans.

In the last four months of the year, however, city bank business loans slid off again in response in part at least to seasonal influences.

• Generally this year's decline in business loans did not spring from a stringency of credit. Banks had ample funds to satisfy sound credit requirements. Bankers, however, scrutinized loan applications more carefully and weeded out credits which appeared vulnerable to a changing economy.

POSTWAR DECLINE IN U. S. **GOVERNMENT SECURITY PORTFOLIOS REVERSED**

Total U. S. government security portfolios in Ninth district member banks increased 5% in 1949 to \$1,730 million, breaking the downhill trend which had held sway since the end of World war II. City banks added \$65 million of government securities to their holdings, while country bank portfolios rose \$19 million.

The turning point in the trend of U. S. government security portfolios did not in fact occur until May 1949. In the first four months of the year banks liquidated securities to meet deposit withdrawals incident to income tax collections.

The chief factor in the sharp rise in security porfolios in the remainder of the year was the successive reductions in reserve requirements for member banks. In city banks the rise in investments was also induced by the decline in loans.

From May through September 1 reserve requirements against demand deposits for all member banks were pared down by 4% and against time deposits by 21/2%. (See chart.)

The reductions in reserve requirements released about \$3.8 billion in the nation's member banks for lending or investing. Of this, roughly \$106 million was in Ninth district member banks.

Reserve city banks were quick to put newly available funds to work in the government securities market --- mainly in short-term issues. Excess reserves were held down to about the same narrow margin as existed before the reductions.

Country banks also withdrew from the Federal Reserve bank most of the funds released from required reserve accounts. Typically, however, country banks hold a larger margin of excess reserves than city banks.

Country banks used their newly available funds to buy U. S. government securities-although to a smaller extent than city banks-to meet increased demand for loans, and to build up correspondent balances in other banks.

During 1949, changes in the government security portfolios of Ninth

district banks reflected two major factors: one, the net purchase of securities, mainly short-term issues, made this year; and the other, the refunding operations of the Treasury.

Throughout most of 1949 called or due certificates, notes, and bonds were rolled over into new one-year certificates. On December 15, a 41/4 year, 13/8% Treasury note was offered in exchange for certificates and bonds due or called on that date.

The refunding operations explain a decline in holdings of government bonds in spite of the fact that banks made net purchases of bonds during the year.

Other securities—mainly municipal and high-grade corporate issues -also advanced in Ninth district member banks in 1949. In city banks other security holdings registered a plus \$34 million, in country banks a plus \$6 million.

FEDERAL RESERVE FOLLOWED **'EASY MONEY' POLICY**

At the end of 1948 the U.S. economy rode over the crest of the boom and slid into a mild recession. Accordingly, Federal Reserve policy was tailored to meet the changing

economic conditions.

Early in 1949 the Federal Reserve System shifted from its anti-inflation program of 1948 to a more or less neutral position and then to a positive easy money program.

In March, consumer credit controls were relaxed. Also, margin requirements for purchasing listed stocks were cut from 75% to 50%. Consumer credit regulations were further eased in April, and on June 30 the Board's temporary authority to control consumer credit expired.

The reductions in reserve requirements described above were a major plank in the Reserve Board's platform of loosening credit conditions.

Probably the most significant change in Reserve bank policy this year was the modification of open market policy in the last half of the year. On June 28, 1949, the Federal Open Market committee announced that "with a view to increasing the supply of funds available in the mar-

ket to meet the needs of commerce, business, and agriculture it will be the policy of the committee to direct purchases, sales, and exchanges of government securities by the Federal Reserve banks with primary regard to the general business and credit situation. The policy of maintaining orderly conditions in the government security market and the confidence of investors in government bonds will be continued. . ."

During the war the overriding aim of Federal Reserve policy was the maintenance of a relatively fixed pattern of rates on government securities. In the postwar years this aim conflicted with the goal of adjusting the money supply to general business conditions.

For example, in 1948 the Reserve banks purchased huge quantities of government bonds in order to support bond prices at or near par. These purchases channeled reserve funds to commercial banks. At the same time the Reserve System was pursuing an anti-inflation program directed at mopping up reserves.

In the first half of 1949 the shoe was on the other foot. Investors sought government bonds as other sound outlets for funds diminished. To prevent a disorderly rise in bond prices (decline in yields) the Reserve System sold government bonds in the open market.

As stated in the June 28 announcement, these sales of bonds had "the undesirable effect of absorbing reserves from the market at a time when the availability of credit should be increased."

The reorientation of policy signaled that open market operations would henceforth be on a more flexible basis. It stressed the general business and credit situation as the primary consideration determining Federal Reserve open market operations.

To implement its new policy, the Federal Open Market committee abruptly suspended sales of government securities. As a result, a rapid advance in prices and a corresponding decline in yields took place throughout the entire list.

The Reserve System maintained its "hands off" policy in the bond end of the market throughout July. However, on the short end of the market, the rate decline was so swift and sharp that the Reserve System sold a substantial amount of bills and certificates to maintain orderly market conditions.

Federal Reserve sales of bonds in the open market did not reappear until the last week in October. Since then, however, relatively small sales of bonds from the System's account have dampened somewhat the continued rise in bond prices (decline in yields).

OTHER THAN INTERBANK DEPOSITS DROPPED SLIGHTLY

Demand deposits, other than interbank, declined from \$2,233 million at year-end 1948 to \$2,209 million by December 28, 1949 — a drop of 1%. This decline was concentrated in country banks, where declining cash farm income, coupled with sustained expenditures, cut into farmers' liquid assets.

In the district as a whole demand deposits declined in the first three

Concluded on Next Page

months of 1949 as income tax payments channeled funds from private deposits to the Treasurer's account in the Federal Reserve bank.

Throughout most of the remainder of the year Treasury operations siphoned funds back into the money stream as Treasury expenditures exceeded receipts. In the fiscal year 1949 the federal government ran up a deficit of \$1.8 billion, marking a return to deficit financing after two years of being in the black. The deficit for fiscal 1950 is estimated at \$5½ billion.

To the extent that a deficit is financed out of accumulated cash balances of the Treasurer or from receipts of sales of Treasury tax savings notes or savings bonds, the total money supply is not affected. However, if new securities are sold to banks, the money supply is correspondingly increased.

During 1949, financing the deficit by new issues got underway with increases in several weekly bill offerings. The Treasury was able to hold such financing to a relatively small volume, however, due to the large sale of Treasury tax savings notes, mainly to corporations.

In Ninth district member banks demand deposits, other than interbank, followed their usual seasonal pattern of a sharp decline in the first three months followed by a generally rising trend in the remainder of the year.

In country member banks the level of other demand deposits held fairly close to the record of a year ago during the first eight months of 1949. From September through December, however, country bank deposits fell sharply below the level of the previous year. This reflected reduced receipts from farm marketings due to

lower prices and lower production.

In the city banks other demand deposits held above the record of a year ago in almost every month. At the same time, however, a drop occurred in the velocity of deposits—the number of times a deposit dollar changes hands during a year. The annual rate of turnover in 1949 averaged 13.2 turns compared with 14.4 in 1948. (Velocity figures are based on reports received from a group of Ninth district banks in larger cities.)

Two other significant changes took place in Ninth district member banks in 1949. One, time deposits decreased from \$941 million at yearend 1948 to \$930 million at yearend 1949, with the lion's share of the decline occurring in country banks. The other, capital accounts rose \$13 million or 6% in 1949, continuing their upward trend of the past several years.

1950 INHERITS RENEWED VIGOR OF '49 ECONOMY

Continued from Page 2

prise when this expectation failed to materialize. For the year as a whole, both consumer income and expenditures were about equal to the levels of 1948, the former at \$212 billion and the latter at \$179 billion.

Looking further into consumer income, spending, and saving in 1949, one discerns some interesting shifts over 1948. Disposable income (income after taxes) although slightly higher last year than for the previous year, drifted downward from late '48 figures. Personal saving declined. Consumption expenditures remained at almost a stationary level for the two years. Corporate income and farm income declined.

Doubtless it was the stable, high level of consumption expenditures that caused businessmen to shift from a policy of inventory liquidation to inventory accumulation from the first to the second half of the year. A larger proportion of those expenditures were made for services and durable goods, notably automobiles, than in the previous year.

Sales of nondurables slipped in dollar volume because of price declines, which, however, helped sustain the

physical volume of such goods sold. Dollar volume of department store sales fell about 5% below 1948, while the physical volume of such sales has been estimated to have been maintained at about the same level.

TREND IN NET PERSONAL SAVING WAS DOWNWARD

Although net personal saving (gross saving less increases in consumer debt and decreases in liquid assets) was as high last year as a whole as it was for 1948, it declined steadily in each quarter.

The most interesting aspect of personal income and expenditures in recent years is that there has been a marked upward trend in the amount of dissaving by the lower-income groups.

According to findings in the consumer finances survey conducted under the auspices of the Board of Governors of the Federal Reserve System, the lowest 40% of spending units (who in 1948 received 15% of the net personal income) spent more than their current incomes. They were able to do so by drawing on the liquid assets they had accumulated in the war years, and by going into debt.

The highest two-fifths of spending units (who received 69% of net personal income) accounted for practically all of net personal savings of all spending units. The middle and lower income groups, despite the fact that they have spent more than their incomes for nondurable goods and services, nevertheless spent freely for durable goods, such as automobiles, in the last two years when such goods have become more readily available.

Not only has high dissaving on the part of a large segment of the population contributed to the high level of business activity, but personal saving in the form of investment in tangible assets, such as homes, business, and farm equipment also has made a mighty contribution. When debt on tangible assets, plus debt on consumer durables, is subtracted from the increase in liquid assets, the result is known as net financial saving. The amount of such net saving, which was extremely large during the war years, has been negligible since 1946.

SLUMP OCCURRED IN GROSS PRIVATE INVESTMENT

The chief components of gross private domestic investment are (1) construction, (2) equipment, and (3) inventory accumulation. Separately and jointly these are volatile factors in the business situation and outlook. The size of the total, which was an estimated \$45 billion in 1948, indicates its significance in the economy.

Also indicating the significance of business investment in a given period of time is the fact that such expenditures declined by \$8.2 billion in 1949 over 1948, or about 18%. This compares with a decline of only \$3.7 billion in gross national product. Evidently the drop in this factor, especially when it is known that consumption expenditures were remarkably stable in the two years, was the major factor in the decline in business activity last year.

Glancing at the components of business investment, one may observe that a small decline in producers' expenditures on equipment was offset by about an equal increase in new construction. There was nothing small, however, in the changes in business inventories, as is shown in the accompanying table.

The course of business activity in 1949 can be traced largely in terms of changes in business inventories. The third quarter of '49 compared with the fourth quarter of '48 indicates a rate of change in business inventories of \$11.4 billion on an annual basis. Other factors on the plus side in gross national product could not offset this drastic change in business inventories.

GOVERNMENT CASH RECEIPTS DECLINED

The volume of cash receipts by the federal government declined \$3.5 billion in 1949 over 1948, while its cash payments increased \$6.2 billion.

The result was a shift from a federal cash surplus of \$8.0 billion to a deficit of \$1.7 billion. Among state and local governments a cash deficit of \$0.8 billion in 1948 increased to a deficit of \$1.4 billion in 1949. Thus all governments—federal, state, and local—suffered a deterioration in their finances.

NOTABLE INTERNATIONAL DEVELOPMENTS

The most significant developments in international trade and finance in 1949 were (1) the depreciation of many currencies, and (2) the drastic decline in the surplus of U. S. exports of goods and services from the second quarter, when that surplus was \$8.0 billion, on an annual basis, to the fourth quarter, when it was \$3.8 billion a year. The impact of these developments on the U. S. economy was not apparent at the year's end. END

FARMERS' PURCHASING POWER PARED DURING '49

Continued from Page 4

prices reduced his purchasing power from what it had been for several years. One way to partly avoid the stark reality of a decline in farm income was to use more credit. This the farmer did in 1948 and again in 1949.

Non-real estate loans to farmers in this district, exclusive of CCC loans, increased sharply during 1948. (See table in annual statistical supplement.) In fact, in Montana it was nearly trebled and in North Dakota nearly quadrupled.

During 1949 the trend in chattel credit to farmers has continued to expand, and although data from the December 31 call report are not yet fully tabulated and analyzed, there

is evidence that a further increase in farmers' use of short-term credit actually occurred. Preliminary estimates indicate the increase in 1949 as 15-30% higher compared with 1948.

The sharp increase in farm loans has caused some banks in the district to view their loan portfolios with considerable concern.

In contrast to the sharp expansion in farm chattel debt, farm real-estate mortgage indebtedness increased only slightly during 1949, according to preliminary estimates. This indebtedness is now about what it was in the mid-1930's and it is at a relatively low level.

DISTRICT FARM LAND VALUES TURN DOWN

For the first time since the early 1930's, land values in most Ninth district states turned downward during 1949. Minnesota was the only

exception. A 1% increase in Minnesota land values occurred from November 1948 to November 1949. (See map.)

Compared with much of the U. S., farm land values in the Ninth district were slow to get up steam in the early war years. However, values in recent years have forged ahead, particularly in the Dakotas and Montana, where they are more than double the relatively low figures that prevailed in 1940.

There is statistical evidence, however, that in spite of the price spurt in recent years, district land values are relatively low in terms of post World war I peaks. Many also argue that district land values are not particularly out of line with present farm prices and incomes. Land values are, however, closely associated with farm income levels. When income falls, there is an inevitable decline in farm land values sooner or later.

AREA BUSINESS BELOW '48 BUT UP AT YEAR-END

Continued from Page 6

reported by the Minneapolis and St. Paul Builders exchanges.

By far the largest number of contracts have been let for public and private school buildings. Institutions of higher learning also continue to expand their facilities. Contracts let for hospitals, medical clinics, churches, and other buildings of a service nature ranked a strong second in number.

On the contrary, a small number of contracts were let for industrial buildings. The number let for retail and wholesale outlets also were small, but this may be, in part, seasonal.

DEPARTMENT STORE SALES DOWN 5% FROM 1948

The downward trend in department store sales which began late in 1948 continued throughout most of 1949. Two rallies, one in April and the other in December, the two big holiday months, temporarily brought sales above the 1948 level. However, the other months weighted the total for the year down to 5% below the 1948 dollar volume. Sales started to improve after the low was reached in July, but they did not reach 1948 levels until December.

In general, this is the picture of 1949 sales in both the Ninth district and the United States. A look at the sales index shows that the trend in this area, while very similar, is slightly below that of the nation, dropping significantly during the winter months.

There are various reasons for the dollar volume of sales in 1949 not measuring up to the peak year which preceded it. First, the 1949 level of prices, as shown by the Fairchild index of retail prices, which does not include special sales, was 2% below

1948. A second contributing factor was some contraction in employment. The third reason was that much of the wartime consumer demand had by last year been fulfilled, especially in the housefurnishings line.

While sales in the whole district were down, there has been a noticeable decline during recent months in rural sales. Since the marketing of the 1949 crop began, farmers have been more cautious in their buying. They found that costs are still high and the prices they received were down considerably from a year ago.

In the past four months, sales in rural areas averaged 91% of the comparable period of 1948, while in the four large centers—Minneapolis, St. Paul, Duluth, and Superior—sales averaged 99% during the same period. In December, city sales were 3% above and country sales 2% below those of the previous December.

DEPARTMENTAL SALES REFLECT MIXED TREND

Departmental sales in the Ninth district also followed those of the United States rather closely. Main store sales began to decline in the autumn of 1948. The Easter rally brought them up to the level of 1948, and thereafter they declined until July.

Sales had improved since mid-summer, but by November they had not come up to those of 1948. Even basement store sales, which had remained

Note that with this issue the Monthly Review begins Volume 10 and a new set of serial and page numbers. Attention should probably be called at this time to the first two issues in 1947, which were incorrectly numbered. Both January 1947 and February 1947 were labeled Volume 8, Serial 61, whereas both should have been Volume 9, and February 1947 should have carried Serial 62.

so strong throughout 1948, began to drop late in 1948 and by mid-year had fallen below the previous year.

Sales in housefurnishings departments were the first to contract the total of main store sales in September of 1948. However, they strengthened considerably toward the end of 1949. Active sales of television, radios, and phonographs have been an important part of total sales in these departments.

Other declines reported in piece goods, miscellaneous, and small wares departments came later and were less severe. Sales in these three departments also improved during the fall of 1949.

Women's apparel and accessory sales declined markedly and remained below the level of a year ago, with the exception of an Easter spurt. Men's wear also increased in April, but in contrast to sales of women's apparel these departments have since remained above 1948.

Sales of men's and boys' wear, in comparison with the 1948 dollar volume, made a stronger showing in this area than nationally. However, it is important to point out that in this district the sales of men's and boys' wear were rather low in 1948.

DEPARTMENT STORE STOCKS CONTINUE TO RISE

Department store stocks, which rose with sales in 1948, declined abruptly with January clearances in 1949. In both the district and the nation, retailers let stocks decline about 7% until late summer, when they began to accumulate stocks again.

Department store stocks during December rose 2% after an adjustment was made for the usual seasonal decline. As a result, the adjusted index of department stores stocks in this district stood at 305% of the 1935-39 base period, while the adjusted index of department store sales stood at 267%.
